

# Protect Your Feed Dollar

with MYCO CURB<sup>®</sup> brand Mold Inhibitor

**Feed is the single largest cost input in your production. Moldy grain costs you money, time and productivity. Why pay the price when you can profitably combat mold problems with MYCO CURB?**

Common molds—aspergillus, penicillium and fusarium—infiltrate your bins and feeders and rob your grain of energy, vitamins and amino acids. Before you realize a problem exists, molds left unchecked can produce mycotoxins, namely aflatoxin, T-2 toxin and zearalenone.

Kemin provides a full line of mold inhibitors, each formulated with a precise blend of organic acids tailored to control mold and yeast growth in your specific feeding environment.

**Not all mold inhibitors are created equal.**

For more than 40 years, Kemin has been recognized as the market leader in curbing mold growth and therefore mycotoxin production. Ask your Kemin representative to explain the differences. No other company can provide you with the proven products, technical expertise, and laboratory support that you get from Kemin. That's the Kemin level of service the agricultural industry has come to trust.
